

# Information Security Management System

An Information Security Management System (ISMS) is a set of policies and procedures implemented by organisations to manage information risks such as cyberattacks or data theft. ISO 27001 is the auditable internal standard that requires a company to establish, implement and maintain best-practice information processes via its ISMS.

## Why an ISO 27001 certification is good for business

### Protect Your Assets and Reputation

- Protect your organisation against information security threats

### Comply with the Latest Regulatory Requirements

- Ensure the implementation of proper security controls aligned with the latest business, legal, contractual and regulatory requirements

### Minimise Penalties and Losses from Data Breaches

- Minimise the risk of financial penalties and losses caused by data breaches due to non-compliance with information security requirements

### Gain Competitive Market Advantage

- Boost market recognition, business growth and customer retention through innovative and competitive policies

### Enhance Security Audit Practices

- Gain access to regular reviews and internal ISMS audits to ensure improvement and maximum security protocols efficiency

## Driving compliance, sustainability and performance with our popular MSXCYBER Modules:
